| | Texas A&M University - Qatar is seeking pricing for a Capillary Pressure Desaturation Cell as per the following: | | | | |
| 1 | Capillary Pressure Desaturation Cell as per the following specifications: Maximum desaturation process: 200 psi Minimum desaturation process: 0.1 psi Chamber internal height: 4 (100 mm) Chamber internal diameter: 12 (300 mm) Ceramic plate pressure: 1 bar, 5 bar, 15 bar Wetted materials: 316 Stainless steel Air Pressure requirements: 0- 250 psi The multi-sample desaturation cell simultaneously desaturates a set of consolidated core samples by virtue of the porous plate method. The multiple sample desaturation cell is manufactured from stainless steel and resting on its base is a semi-permeable ceramic plate. The desaturation cell consists of a pressure vessel, with an easy opening lid, clamping bolts, O-rings, seals, tubing and a pressure control panel. Three different operating pressure ceramic plates are provided with the systems; namely, 1 bar, 5 bar and 15 bar. The control panel includes a digital pressure display, two low and high range pressure regulators and a set of control valves. Moreover, an in-line gas humidifier is integrated into the circuit to prevent in-situ evaporation during the desaturation | 2 | LOT | 21,139.650 | 42,279.30 |

| | process. Previously weighed, fully saturated core samples are placed on a ceramic porous plate in a pressure vessel. The vessel is then shut and pressurized gas is injected into it via the inlet; the injection pressure must remain below the ceramic's nominal operating pressure so that gas does not flow through it. The pressurized gas will enter the samples and displace the water through the porous plate and into a collection container until the capillary pressure in the samples matches that of the pressure vessel. At this point, the cell is vented and the samples are weighed again with a high precision balance. The dry, fully saturated, and current weights of the sample yield its current saturation at a particular capillary pressure. The procedure is repeated at incrementally higher pressures until the maximum porous plate pressure has been reached (15 bar). Once the experiment is completed, capillary pressure-saturation curves can be elaborated. Furthermore, knowledge of the brine density and salt concentration permit a corrected water saturation | | | | |
